

# USE CASES

## Liveness Detection

Customer integrates VerifyMe liveness widget into their app.

Customer enters full name and ID number on VerifyMe widget pop-up.

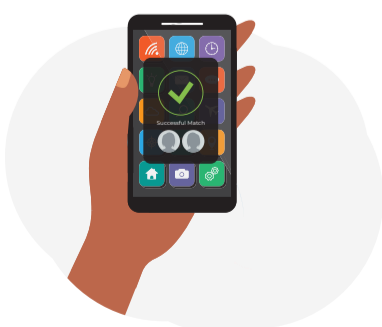

Customer is asked to perform an action, such as blinking, to start the liveness check.

VerifyMe AI/automated technology runs and returns a successful or unsuccessful ID match.

If unsuccessful, customer receives a notification that their face was undetectable plus a prompt to ensure ALL instructions are properly followed when/if they try again.

If successful, a side-by-side match of the image taken via the liveness check and the photo retrieved from selected ID is returned, along with the customer's full name, ID number and a message confirming the identity has been verified.
